Social Cost Survey

11/19/2019

Introduction

For the analysis on social cost we needed to quantify exactly how an involuntary and voluntary organ *donation* system would affect society. The philosophy here is that we can quantify and monetize the cost to society of having prisoner kidneys harvested by simpling asking what compensation they would require, if any, if they were in the poosition of a prisoner. Since we are not giving prisoners standing, these numbers may or may not make it into the final analysis.

Survey Format

The survey format can be viewed [here](#)

Survey Taker Demographics

Table 1: Sex

	x
Female	13
Male	52
NA's	2

```
## `stat_bin()` using `bins = 30`. Pick better value with `binwidth`.
```

```
## Warning: Removed 4 rows containing non-finite values (stat_bin).
```

Visualizations and Analysis

Do you have an objection?

Table 2: Question 1

No

Yes

A

The majority of people don't have an objection to having their organs harvested in prison. At the

We will **not** use the median response in our analysis of social cost. Rather we will use the presented

Would you accept compensation?

<hr/>	
	x
<hr/>	
No	6
Yes	2
NA's	59
<hr/>	

Analysis

Since the majority of people didn't have an issue with having their organs donated, only 8 people answered this survey, and from that 8 people only 2 said that they would require compensation. Since the sample size is so small we should still use the probability that compensation is needed to keep the cost on the more conservative side. This will then be multiplied by the number of people who weren't willing to have their organs donated. The statistic here is 25%. Very sensitive, very weak.

How many USD?

Table 4: All responses for Question 3

Var1	Freq
1000000	1
1920000	1

The two responses we received were neither reasonable or tangible and a sample size of 2 is not reasonable. However, factoring in the theoretical \$0 amounts from the majority of the survey takers we can get a mean number of \$34,000

Would you opt-in to being screened?

Table 5: Question 4

	x
No	25
Yes	36
NA's	6

Analysis

51% of respondents said that they would be willing to be screened for a live organ donation.

Would you be willing if your family receives compensation?

Table 6: Question 5

	x
No	13
Yes	12
NA's	42

Analysis

Of the respondents that said no to Question 4, almost 50% of them said they would agree if their family gets compensated.

Acknowledgments

We are aware that this survey is not a good approximation of reality. However, it is the best we could do given the time frame of the project. We are in no way suggesting that the answer statistics shown in the response data is an accurate reflection of reality. Alas, it is the only real data we could acquire on this topic and therefore the best we have.
